

# System Enhance

Over time refrigeration oil and components lose their polarity leaving the oil to travel away from the compressor causing increased friction and significant strain on the moving parts of a system. Vapco's System Enhance is designed specifically to reverse the polarity of these components and return oil to the compressor. By removing the insulated buildup and binding to the metals inside the system, our Enhance can significantly increase the efficiency of older and even brand new systems.

Once this new conductive layer of oil/lubricant is formed in the compressor, the system's ability to transfer heat increases dramatically. Tests have seen mechanical friction reduced by 1500%! Our testing has seen an 11 to 15% reduction in amp draw as well as a 2 degree temperature drop across the evaporator coil. You will also notice a decrease in compressor noise almost immediately after introducing this product into a system. All of this equates to a simple, effective way to save energy and money on new and old systems alike.

## Key Features

- Major Energy Savings
- Increases Life and Longevity of System
- Saves Money During Hot, High Usage Months
- System Enhance is Found in Overhaul, Kitchen Sink and Kitchen Sink with Dye
- Also Available Individually in a 5 Ton Applicator
