

# System Protect

One of the biggest threats to a properly functioning system is moisture inside the refrigerant lines. If not properly treated, acids can quickly form causing leaks, refrigerant instability, burnouts and complete system failure. The only product in the industry formulated to attack and prevent this issue is Vapco's System Protect.

System Protect contains a 3 pronged offensive and defensive approach to remove acid, remove moisture and help prevent the formation of acid. Our acid scavenger neutralizes any acid in the system, then the moisture remover converts it into a synthetic lubricant that is compatible with the oils already in the system. The remaining System Protect continues to scour the lines looking for any moisture or acid formation to immediately begin to remove it from the system. While not for use in ammonia systems, Vapco's Protect is compatible with all other refrigerants and oils.

The industry finally has an all in one product to scavenge acid, remove moisture and prevent acid from forming.

## Key Features

- If acid formation is system cancer - System Protect is cancer prevention!
- Moisture and acid in a system eventually causes system failure, but reduces efficiency and effectiveness immediately.
- System Protect is found in Seal and Protect, Overhaul, Kitchen Sink and Kitchen Sink with Dye.
- Also available individually in a 5 ton applicator.
- Can be used in conjunction with Xpress Seal to ensure all moisture has been removed from the system.
- Moisture can end up in a system from a variety of reasons: there is a leak and insufficient pressure allowed moisture to enter, refrigerant used to charge system was low quality and contained some moisture, previous technician had moisture in gauges and improperly hooked up and introduced moisture into system.
